

TEOSYAL

Teosyal is a full range of injectable fillers made of biodegradable Hyaluronic Acid (HA) of non-animal origin. A naturally occurring component that retains moisture, HA has the ability to keep skin plump, soft and hydrated. Aesthetic Physician Dr. Christina Chea speaks about the range.

What are Teosyal RHA and the Teosyal Classic Range?

Teosyal RHA is the latest patented hyaluronic based wrinkle filler for the mobile areas of the face. The product respects facial expressions by supporting the skin's movement and maintaining its vitality and softness. Best administered on animated facial regions including the perioral areas, cheeks, nasolabial folds, foreheads and crow's feet, Teosyal RHA has capabilities of improving deep hydration, skin tone and elasticity. This filler comes in four resilient gels – RHA 1,2,3,4 – to suit different needs. RHA contains such pure levels of hyaluronic acid that it almost mimics the naturally occurring HA found in our skin.

The Teosyal Classic Range has four forms of fillers that include Essentials, Enhancers, Volumizers and Specifics. Essentials fillers boast First Lines for correction of superficial lines and Global Action for the reduction of medium lines of the face. Others in this range also include Touch up for final touches and Deep Lines for filling of the deeper layers.

Enhancers contain PureSense Redensity 1 and Meso. PureSense Redensity is a skin booster with Dermo-Restructuring Complex that combines three antioxidants, eight amino acids, two minerals and Vitamin B6. These ingredients are perfectly safe as they are naturally present in the skin. They work synergistically with HA as a beauty booster to improve dermal glow, elasticity, texture and hydration. It's highly recommended for patients who are beginning to notice first signs of fine lines, creases, dermal thinning, poor hydration and pre or post prolonged sun exposure. When administered frequently to the face, neck and neckline, PureSense Redensity 1 not only reduces skin aging but also protects and stimulates the skin. Meso helps revitalise the skin by improving skin hydration.

Volumizers are used to correct and augment areas with volume loss due to aging factors such as loss of fat, hyaluronic acid and elasticity under the skin and bone resorption. There are two types of Volumizers. Ultra Deep corrects volume loss at targeted areas (forehead, cheeks, cheekbones, nasolabial folds and laugh lines). Ultimate is for volume loss in wider areas, which is best suited to facial volume enhancement and contouring.

The Specifics range offers PureSense

Redensity 11 or RD 11 and Kiss. RD 11 contains the Dermo-Restructuring Complex that contains all the ingredients of RD 1. Best used under the eyes for tear trough correction, it helps lighten hollow, dark circles while reducing the look of tired, sleep-deprived eyes. Unsurprisingly, RD11's award-winning formula provides exquisite results that are natural, safe and long lasting. Kiss aids in the enhancement or plumping of the lips.

There are multiple types of Teosyal fillers. How do these fillers differ and how can patients choose between them?

There are four filler types under the newer Teosyal RHA range and 16 types under the Classic Range. The main filler types have been mentioned earlier and not all are available in some countries. They differ in indications and target areas, with some containing lidocaine. Attending doctors choose suitable fillers based on individual needs. We may even use a combination of fillers for total or partial rejuvenation, depending on what's wanted, cost factors and desired filler longevity. My favourites are PureSense Redensity 1 and 11, Ultra Deep, Ultimate and the newer RHA Range.
